

UI/UX Designer : Technical Assignment

Deadline 24 hours | Eight screens | Desktop first

Background

You are designing a business-to-business travel platform. Its users are travel agents and consultants, not holidaymakers. They receive enquiries from corporate clients and partner agencies, assemble multi-service trips, price them, and send quotations. Two groups use the product. Internal agents have full access. Partner agencies log in to a narrower version and see only their own work.

The product has no name yet. Choose one. Name it, and build a visual identity around that name. We are as interested in what you call it and why as in how it looks.

Two things shape every screen in this brief. First, **users are experts working at volume**. A busy agent handles dozens of enquiries a day and knows the domain far better than the software does. Generous whitespace that costs a scroll is a cost, not a courtesy. Second, **agents work across three very different service types** : flights, hotels and restaurants, which share almost no data in common yet must feel like one product.

The Assignment

Design the eight screens below as a coherent set. We are looking for breadth and consistency across the product rather than one screen polished to death.

Screens 4 to 8 carry the most weight. The first three should establish the visual language quickly.

1. Splash screen

The first thing shown while the application loads. It carries the name you chose and sets the tone for a professional tool used all day. It should not feel like a consumer travel advertisement.

2. Login

Email and password, with forgotten-password and first-time password setup.

- Internal agents and partner agencies use the same entry point.
- Show the error state for wrong credentials, and the state for an account that exists but has not been activated yet.

3. Dashboard

The screen an agent lands on each morning. Its job is to answer *what needs me today*, not to display decorative statistics.

- Enquiries waiting for a response, and those going stale.
- Quotations sent but not yet accepted or declined.
- Bookings requested but not yet confirmed by the supplier.
- Decide for yourself what a partner agency sees here instead, and show it.

4. Enquiries list

Every open and recent enquiry. An agent may have two hundred, and needs to find one in seconds.

- Each row carries a client name, destination, travel dates, number of travellers, value, owner and status.
- Status is not simply open or closed. An enquiry can be new, quoted, accepted, partially booked, fully booked, or lost.
- Show how filtering and searching work, and what the screen looks like with no results.

5. Trip detail

A single enquiry opened up. This is where an agent spends most of the day, and it is the hardest screen in the product.

- Client and trip information, travellers, and the services added so far.
- A trip mixes flights, hotels and restaurants in one list. Each needs a summary that makes sense for its own type, while the list still reads as one thing.
- Each service carries its own status and its own price, and the trip has a total.
- Adding a new service should not feel like leaving the page.
- Handle a trip with fourteen services as well as one with none.

The next three screens are where an agent searches for and selects each kind of service. They are the heart of the assignment. The challenge is that the three have almost nothing in common, yet a designer has to make them feel like siblings.

6. Flights: search and select

Airline results are dense and comparison is the whole point.

- A result carries airline, departure and arrival times, total duration, number of stops, and the airports of each connection.
- One flight is usually sold at several fare levels, such as economy, premium and business, at different prices, with different baggage allowances and different cancellation rules. Show them so they can be compared.
- Connections matter: a two-stop itinerary must read clearly, including a tight layover or one that runs overnight.
- Include the state where a search returns nothing.

Designing the passenger forms, seat maps or ticket issuance is **not** part of this assignment. Stop at selection.

7. Hotels: search and select

A completely different shape of problem. Where flights are a time-and-price comparison, hotels are visual and the decision is made on the property first, the room second.

- Results carry photographs, star rating, location, guest score and a lead price.
- One property offers several room types at different rates, with different board basis such as room only, bed and breakfast or half board, and different cancellation terms. The agent picks a specific room, not just a hotel.
- The client booked three rooms for five nights. Show how quantity and duration are handled.
- Include a property with no photographs available, which happens often.

8. Restaurants: search and select

The smallest of the three, and the one most often designed badly because it seems simple.

- Results carry cuisine, location, price band and whether the restaurant takes bookings at all.
- The agent is booking a table for a specific date, time and number of covers. Availability is the constraint, and the requested time is frequently unavailable.
- Show the case where the exact time is not available but nearby times are.
- Some restaurants cannot be booked through the system and must be arranged by telephone. Make that clear without making it look broken.

Alongside the Screens

Include these three things with your submission. They matter as much as the screens.

A token set

Colour, type scale, spacing, corner radius and elevation, enough for an engineer to build from. Include the semantic states this domain needs. A service is not simply active or inactive: it may be draft, quoted, requested, confirmed or cancelled. Decide how state reads at a glance.

Core components in their real states

Buttons, inputs, tables, tabs, status indicators, modals, toasts. Drawn in the awkward states as well as the tidy ones: a table row with an eleven-word service name, a field with a validation error, a list with nothing in it, a panel still loading.

A written rationale

Around 300 words. The name you chose and why, the direction you took, what you deliberately ruled out, and anything you would have changed with more time.

What We Are Assessing

1. **Consistency across screens** Eight screens that clearly belong to one product, including three service types that share almost no data. This is the main reason we ask for breadth rather than a single polished flow.
2. **Information density** Whether the design suits experts working at volume, rather than a consumer app stretched to fit a professional tool.
3. **Handling of edge cases** Empty, loading, error and unavailable states. Real data is untidy, and designs that only work with ideal content fail in use.
4. **Readiness for handoff** Whether an engineer could build from what you produced without a series of follow-up questions.
5. **Candour** Telling us plainly what you could not finish and what you would need in order to. We weigh that more highly than a polished but hollow submission.

Submission

- A **Figma link**, **PDF**, or **hosted prototype**, whichever you genuinely work in. Tool choice is not being assessed.
- **You have 24 hours from receiving this brief.** We do not expect you to spend all of that designing. Most candidates use somewhere between five and eight hours. If a screen is unfinished, say so and describe what you would have done. We would rather see honest scope than padded work.
- Desktop first. These users work on laptops and dual monitors.
- Use realistic content throughout. Invent plausible airlines, hotels, restaurants, clients and prices. Placeholder text tells us nothing about how the design behaves.

Your work will not be used. Submissions are deleted once the hiring process concludes, whatever the outcome. Nothing from this exercise will appear in our product.
